Example #1 – Linear Programming

Farmer wants to grow **apples** and **bananas**.

	Area needed [m ² /ton]	Fertilizer needed [kg/ton]	Profit [USD/ton]
A	4000	60	700
B	3000	80	600

Farmer has a field of 100 000 m² and can legally use no more than 2000 kg fertilizer.
What to plant to maximize profit?

Example #1 – Formulation

m_a , m_b – mass of apple, and banana

Control variables,

$$w = [m_a, m_b]$$

the profit,

$$P(w) = 700m_a + 600m_b$$

the area used,

$$A(w) = 4000m_a + 3000m_b$$

fertilizer used,

$$F(w) = 60m_a + 80m_b$$

$$\max_w P(w) \rightarrow \min_w [-P(w)]$$

$$\text{s.t. } 0 \leq A(w) \leq 100000$$

$$0 \leq F(w) \leq 2000$$

Optional constraints:

$$0 \leq m_a, m_b$$

Example #1 – Solution in LibreOffice Calc

You go to menu Tools/Solver

	A	B	C	D	E	F	G	H

Example #1 – Solution in CasADi

```
from casadi import Opti

opti = Opti()

mass_apple = opti.variable()
mass_banana = opti.variable()
opti.minimize(-700 * mass_apple - 600 * mass_banana)

area_needed = 4000 * mass_apple + 3000 * mass_banana
fertilizer_needed = 60 * mass_apple + 80 * mass_banana

opti.subject_to(mass_apple >= 0)
opti.subject_to(mass_banana >= 0)

opti.subject_to(opti.bounded(0, area_needed, 100_000))
opti.subject_to(opti.bounded(0, fertilizer_needed, 2000))

opti.set_initial(mass_apple, 5)
opti.set_initial(mass_banana, 5)

opti.solver('ipopt')

solution = opti.solve()

print(f'Mass of apples: {solution.value(mass_apple):.2f} tons')
print(f'Mass of bananas: {solution.value(mass_banana):.2f} tons')
```
